

Clients

Stage 1: Anomaly Detection

Anomaly Detection

Autoencoder
Encoder ϕ_θ + Decoder ψ_θ

Anomaly Scoring
 $a_i = \alpha \cdot e_i + (1 - \alpha) \cdot d_i$

MAD Threshold
 $\tau = \text{med} + k \cdot \text{MAD}$

Normal
 $\mathcal{N} : a_i < \beta_l \tau$

Three-Zone

Uncertain
 $\mathcal{U} : \beta_l \tau \leq a_i < \beta_u \tau$

Anomalous
 $\mathcal{A} : a_i \geq \beta_u \tau$

Stage 2: Committee Voting

Diversity Committee
 $K = 5$ members from \mathcal{N}

Majority Voting
 $v_{c \rightarrow u} = \mathbf{1}[\cos < \gamma]$

Uncertain Resolution

Stage 3: TLBO Aggregation

Robust Aggregation

Reputation Update
 $\rho_i \in [0.1, 2.0]$

TLBO Optimization
Teacher + Learner Phase

Aggregated Update
 $\mathbf{w}^{(t+1)} = \mathbf{w}^{(t)} - \eta \bar{\mathbf{g}}$

Verified Gradients

Evidence Chain
Merkle Tree Log

Global Model Broadcast
